

How to attach a kart on your hoverboard

When mounting the board to a kart or similar mounts, please be aware, that handling can be different than expected and different hoverboard has different handling.

An example is our model Denver HBO-6610 which has a safety feature, preventing accidental turning at high speed, to avoid falling off/injuries. This means, when using a mount on this model, you must reduce speed in order to make turns.

Here is some pointer to what to look for when mounting the Kart

Also, you must make sure the mount is touching the rubber foot pads to secure optimal handling.

Make sure the length of the mount matches the length of the board.

If too short, it will not touch the rubber pads correctly, and then you cannot control it.
